### 5 BACKGROUND OF THE INVENTION

#### 1. Field of the invention

The invention is related to compounds which are CB<sub>1</sub>/CB<sub>2</sub> receptor ligands, pharmaceutical compositions containing these compounds, manufacturing processes thereof and uses thereof, and more particularly to compounds that are CB<sub>1</sub>/CB<sub>2</sub> receptor agonists.

#### 10 2. Discussion of Relevant Technology

Pain management has been an important field of study for many years. It has been well known that cannabinoid receptor (e.g., CB<sub>1</sub> receptors, CB<sub>2</sub> receptors) ligands, especially agonists produce relief of pain in a variety of animal models by interacting with CB<sub>1</sub> and/or CB<sub>2</sub> receptors. Generally, CB<sub>1</sub> receptors are located predominately in the central nervous  
15 system, whereas CB<sub>2</sub> receptors are located primarily in the periphery and are primarily restricted to the cells and tissues derived from the immune system.

While the conventional CB<sub>1</sub> receptor agonists and CB<sub>1</sub>/CB<sub>2</sub> receptor agonists, such as tetrahydrocannabinol (THC) and *Cannabis*-related drugs, are highly effective in anti-nociception models in animals, they tend to exert many undesired CNS (central nerve system)  
20 side-effects, e.g., psychoactive side effects and the abuse potential of *Cannabis*-related drugs.

Therefore, there is a need for new CB<sub>1</sub>/CB<sub>2</sub> receptor ligands such as agonists useful in managing pain or treating other related symptoms or diseases with reduced or minimal undesirable CNS side-effects.

### DISCLOSURE OF THE INVENTION

25 The present invention provides CB<sub>1</sub>/CB<sub>2</sub> receptor ligands which are useful in treating pain and other related symptoms or diseases.

The optically active forms of the compound of the invention may be prepared, for example, by chiral chromatographic separation of a racemate, by synthesis from optically active starting materials or by asymmetric synthesis based on the procedures described thereafter.

It will also be appreciated that certain compounds of the present invention may exist as geometrical isomers, for example E and Z isomers of alkenes. The present invention

- 12 -

includes any geometrical isomer of a compound of Formula I. It will further be understood that the present invention encompasses tautomers of the compounds of the formula I.

It will also be understood that certain compounds of the present invention may exist in solvated, for example hydrated, as well as unsolvated forms. It will further be understood that  
5 the present invention encompasses all such solvated forms of the compounds of the formula I.

Within the scope of the invention are also salts of the compounds of the formula I. Generally, pharmaceutically acceptable salts of compounds of the present invention may be obtained using standard procedures well known in the art, for example by reacting a sufficiently basic compound, for example an alkyl amine with a suitable acid, for example,  
10 HCl or acetic acid, to afford a physiologically acceptable anion. It may also be possible to make a corresponding alkali metal (such as sodium, potassium, or lithium) or an alkaline earth metal (such as a calcium) salt by treating a compound of the present invention having a suitably acidic proton, such as a carboxylic acid or a phenol with one equivalent of an alkali metal or alkaline earth metal hydroxide or alkoxide (such as the ethoxide or methoxide), or a  
15 suitably basic organic amine (such as choline or meglumine) in an aqueous medium, followed by conventional purification techniques.

In one embodiment, the compound of formula I above may be converted to a pharmaceutically acceptable salt or solvate thereof, particularly, an acid addition salt such as a hydrochloride, hydrobromide, phosphate, acetate, fumarate, maleate, tartrate, citrate,  
20 methanesulphonate or *p*-toluenesulphonate.

We have discovered that the compounds of the invention have activity as pharmaceuticals, in particular as modulators or ligands such as agonists, partial agonists, inverse agonist or antagonists of CB<sub>1</sub>/CB<sub>2</sub> receptors. More particularly, the compounds of the invention exhibit selective activity as agonists of the CB<sub>1</sub>/CB<sub>2</sub> receptors, and are useful in the  
25 relief of pain, particularly chronic pain, e.g., chronic inflammatory pain, neuropathic pain, back pain, cancer pain and visceral pain. Compounds of the present invention will also be useful in treating acute pain, anxiety disorders, gastrointestinal disorders, cardiovascular disorders, multiple sclerosis, Parkinson's disease, Huntington's chorea, Alzheimer's disease and/or cancers of the immune system or cells thereof. Additionally, compounds of the present  
30 invention are useful in other disease states in which degeneration or dysfunction of CB<sub>1</sub>/CB<sub>2</sub> receptors is present or implicated.

Thus, the invention provides a compound of formula I, or pharmaceutically acceptable salt or solvate thereof, as hereinbefore defined for use in therapy.

- 13 -

In a further aspect, the present invention provides the use of a compound of formula I, or a pharmaceutically acceptable salt or solvate thereof, as hereinbefore defined in the manufacture of a medicament for use in therapy.

In the context of the present specification, the term "therapy" also includes "prophylaxis" unless there are specific indications to the contrary. The term "therapeutic" and "therapeutically" should be construed accordingly. The term "therapy" within the context of the present invention further encompasses to administer an effective amount of a compound of the present invention, to mitigate either a pre-existing disease state, acute or chronic, or a recurring condition. This definition also encompasses prophylactic therapies for prevention of recurring conditions and continued therapy for chronic disorders.

The compounds of the present invention are useful in therapy, especially for the therapy of various pain conditions including, but not limited to: acute pain, chronic pain, neuropathic pain, back pain, cancer pain, and visceral pain.

In use for therapy in a warm-blooded animal such as a human, the compound of the invention may be administered in the form of a conventional pharmaceutical composition by any route including orally, intramuscularly, subcutaneously, topically, intranasally, intraperitoneally, intrathoracically, intravenously, epidurally, intrathecally, intracerebroventricularly and by injection into the joints.

In one embodiment of the invention, the route of administration may be orally, intravenously or intramuscularly.

The dosage will depend on the route of administration, the severity of the disease, age and weight of the patient and other factors normally considered by the attending physician, when determining the individual regimen and dosage level at the most appropriate for a particular patient.

For preparing pharmaceutical compositions from the compounds of this invention, inert, pharmaceutically acceptable carriers can be either solid and liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets, and suppositories.

A solid carrier can be one or more substances, which may also act as diluents, flavoring agents, solubilizers, lubricants, suspending agents, binders, or table disintegrating agents; it can also be an encapsulating material.

In powders, the carrier is a finely divided solid, which is in a mixture with the finely divided compound of the invention, or the active component. In tablets, the active component

- 14 -

is mixed with the carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired.

For preparing suppository compositions, a low-melting wax such as a mixture of fatty acid glycerides and cocoa butter is first melted and the active ingredient is dispersed therein by, for example, stirring. The molten homogeneous mixture is then poured into convenient sized moulds and allowed to cool and solidify.

Suitable carriers are magnesium carbonate, magnesium stearate, talc, lactose, sugar, pectin, dextrin, starch, tragacanth, methyl cellulose, sodium carboxymethyl cellulose, a low-melting wax, cocoa butter, and the like.

The term composition is also intended to include the formulation of the active component with encapsulating material as a carrier providing a capsule in which the active component (with or without other carriers) is surrounded by a carrier which is thus in association with it. Similarly, cachets are included.

Tablets, powders, cachets, and capsules can be used as solid dosage forms suitable for oral administration.

Liquid form compositions include solutions, suspensions, and emulsions. For example, sterile water or water propylene glycol solutions of the active compounds may be liquid preparations suitable for parenteral administration. Liquid compositions can also be formulated in solution in aqueous polyethylene glycol solution.

Aqueous solutions for oral administration can be prepared by dissolving the active component in water and adding suitable colorants, flavoring agents, stabilizers, and thickening agents as desired. Aqueous suspensions for oral use can be made by dispersing the finely divided active component in water together with a viscous material such as natural synthetic gums, resins, methyl cellulose, sodium carboxymethyl cellulose, and other suspending agents known to the pharmaceutical formulation art.

Depending on the mode of administration, the pharmaceutical composition will preferably include from 0.05% to 99%w (per cent by weight), more preferably from 0.10 to 50%w, of the compound of the invention, all percentages by weight being based on total composition.

A therapeutically effective amount for the practice of the present invention may be determined, by the use of known criteria including the age, weight and response of the individual patient, and interpreted within the context of the disease which is being treated or which is being prevented, by one of ordinary skills in the art.

### Biological Evaluation

#### hCB<sub>1</sub> and hCB<sub>2</sub> receptor binding

Human CB<sub>1</sub> receptor from Receptor Biology (hCB<sub>1</sub>) or human CB<sub>2</sub> receptor from BioSignal (hCB<sub>2</sub>) membranes are thawed at 37 °C, passed 3 times through a 25-gauge blunt-end needle, diluted in the cannabinoid binding buffer (50 mM Tris, 2.5 mM EDTA, 5 mM MgCl<sub>2</sub>, and 0.5 mg/mL BSA fatty acid free, pH 7.4) and aliquots containing the appropriate amount of protein are distributed in 96-well plates. The IC<sub>50</sub> of the compounds of the invention at hCB<sub>1</sub> and hCB<sub>2</sub> are evaluated from 10-point dose-response curves done with <sup>3</sup>H-CP55,940 at 20000 to 25000 dpm per well (0.17-0.21 nM) in a final volume of 300 µl. The total and non-specific binding are determined in the absence and presence of 0.2 µM of HU210 respectively. The plates are vortexed and incubated for 60 minutes at room temperature, filtered through Unifilters GF/B (presoaked in 0.1% polyethyleneimine) with the Tomtec or Packard harvester using 3 mL of wash buffer (50 mM Tris, 5 mM MgCl<sub>2</sub>, 0.5 mg BSA pH 7.0). The filters are dried for 1 hour at 55 °C. The radioactivity (cpm) is counted in a TopCount (Packard) after adding 65 µl/well of MS-20 scintillation liquid.

Based on the above assays, the dissociation constant (K<sub>i</sub>) for a particular compound of the invention towards a particular receptor is determined using the following equation:

$$K_i = IC_{50} / (1 + [rad] / K_d),$$

Wherein IC<sub>50</sub> is the concentration of the compound of the invention at which 50% displacement has been observed;

[rad] is a standard or reference radioactive ligand concentration at that moment; and

K<sub>d</sub> is the dissociation constant of the radioactive ligand towards the particular receptor.

Using above-mentioned assays, the K<sub>i</sub> towards human CB<sub>1</sub> receptors for compounds 1-38 of the invention is measured to be in the range of 29 - 5852 nM. The K<sub>i</sub> towards human CB<sub>2</sub> receptors for compounds 1-38 of the invention is measured to be in the range of 0.7 - 753 nM.

To a solution of 1-(cyclobutylmethyl)-2-[(4-ethoxyphenyl)methyl]-1*H*-pyrrolo[2,3-*b*]pyridin-5-amine (52 mg, 0.15 mmol) in dichloromethane (5 ml) at 0°C was added diisopropylethylamine (78 µL, 0.45 mmol) followed by 4-(dimethylamino)-benzoyl chloride (55 mg, 0.30 mmol). The mixture was stirred overnight at room temperature. The reaction was then quenched by 2M Na<sub>2</sub>CO<sub>3</sub> aqueous solution (10 mL). The phases were separated and the aqueous phase was back-extracted with additional dichloromethane (10 mL). The organic phases were combined, dried with MgSO<sub>4</sub>, filtered and concentrated *in vacuo*. The residue was purified using HPLC (10 to 70% [0.1% TFA in AcCN solution] in 0.1% TFA aqueous solution) to provide 19 mg of the TFA salt of *N*-[1-(cyclobutylmethyl)-2-[(4-ethoxyphenyl)methyl]-1*H*-pyrrolo[2,3-*b*]pyridin-5-yl]-4-(dimethylamino)-*N*-methylbenzamide. <sup>1</sup>H NMR (400 MHz, METHANOL-D<sub>4</sub>) δ 1.25 (t, *J*=6.93 Hz, 3 H) 1.68 (m, 6 H) 2.58 (m, 1 H) 2.76 (s, 6 H) 3.36 (s, 3 H) 3.89 (q, *J*=6.93 Hz, 2 H) 3.96 (s, 2 H) 4.03 (d, *J*=7.22 Hz, 2 H) 5.95 (s, 1 H) 6.40 (d, *J*=8.79 Hz, 2 H) 6.74 (d, *J*=8.59 Hz, 2 H) 7.00 (d, *J*=8.59 Hz, 2 H) 7.06 (d, *J*=8.79 Hz, 2 H) 7.62 (d, *J*=2.34 Hz, 1 H) 7.71 (d, *J*=2.34 Hz, 1 H).
